COGNITIVEOS

You spent 20 years building your APIs. Don't throw them away for agents.

Give them an OS that understands your current system state, plans what needs to happen, and executes it through the APIs you already have.

APIs · Databases · ERP · MES · CRM · Robotics · Workflows · Internal Tools · Integrations · AI Agents · Providers

The arrival of AI agents shouldn't mean rebuilding all of it. **CognitiveOS makes your existing systems usable by autonomous AI.**

FIG. 1 — GOAL TO EXECUTION LOOP

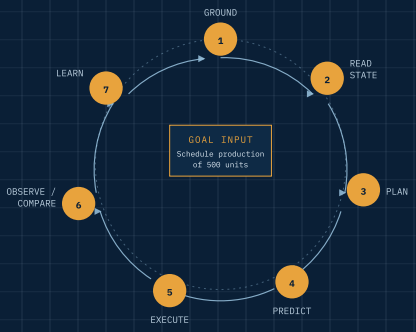

FIG. 2 — EXISTING INFRASTRUCTURE AS CAPABILITIES

YOUR SYSTEM	COGNITIVEOS USES IT FOR
APIs & Services	Actions and transactions
Databases	Current state and operational context
ERP / CRM / MES / WMS	Business and operational grounding
Robots & Devices	Physical-world execution
Workflows & Tools	Existing business processes
Documents & Knowledge	Context and domain knowledge
Internal AI & Models	Specialized intelligence
Existing AI Agents & Providers	Orchestrated as capabilities, not replaced

FIG. 3 — TRADITIONAL AGENT VS. COGNITIVEOS

TRADITIONAL AGENT

`Goal → LLM → Tool call → Result`

Calls an API, but provides no persistent loop around the work.

COGNITIVEOS

`Goal → Ground → Plan → Predict → Execute → Observe → Compare → Learn`

Plans against current state, executes, evaluates the result, and learns from what happened.

N1

Protect your investment

Keep the APIs, systems, and operational logic you've spent years building.

N2

Ground AI in reality

Plans are informed by the current state of your systems, not assumptions.

N3

APIs become capabilities

Your existing APIs become the action layer for autonomous AI.

N4

Beyond single-step agents

Built for multi-step goals, dependencies, failures, and long-running execution.

N5

Build on what you have

Works with your existing AI and technology stack — no wholesale replacement.

Don't rebuild your systems for AI.
Make the systems you already have usable by autonomous AI.
